

Creating Application, Browse Application server and Changing the Port Number-81

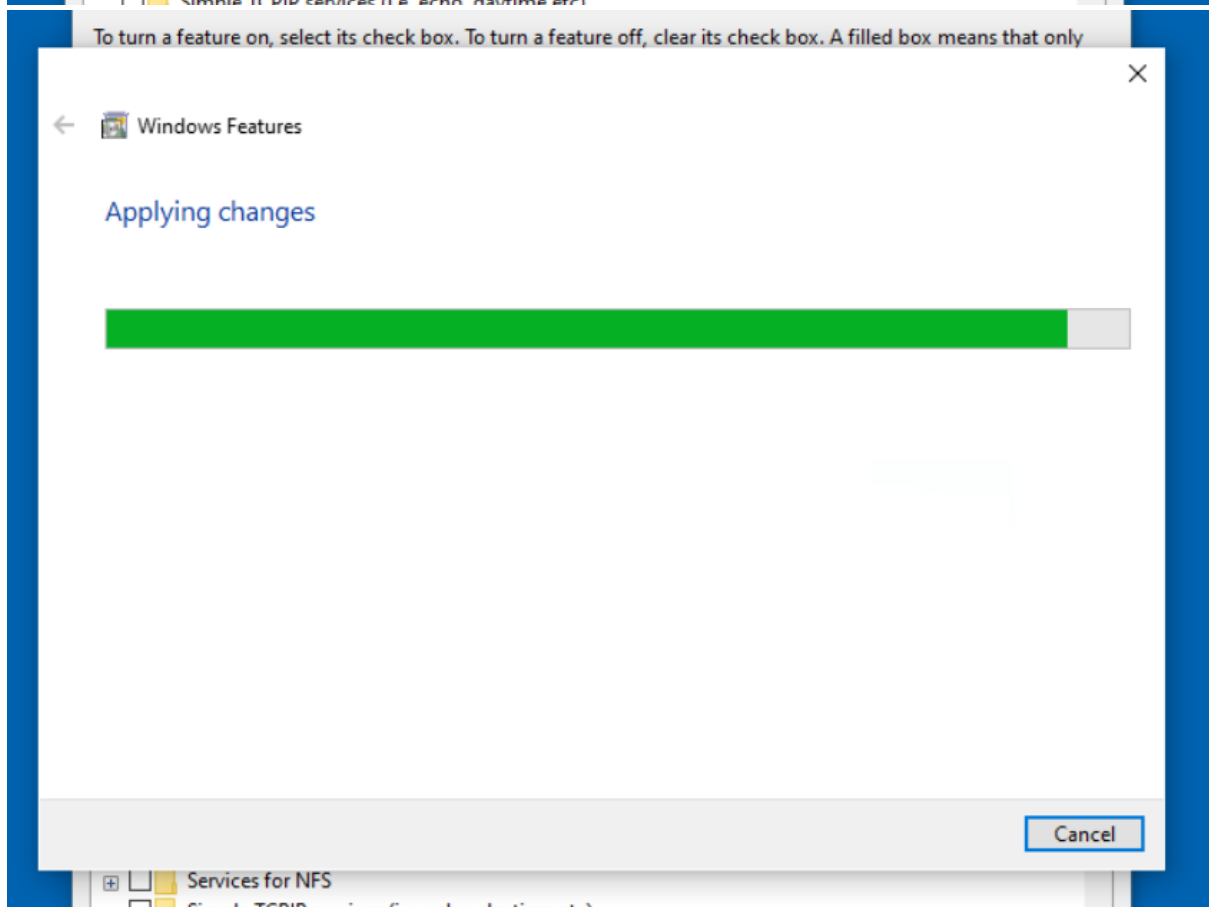

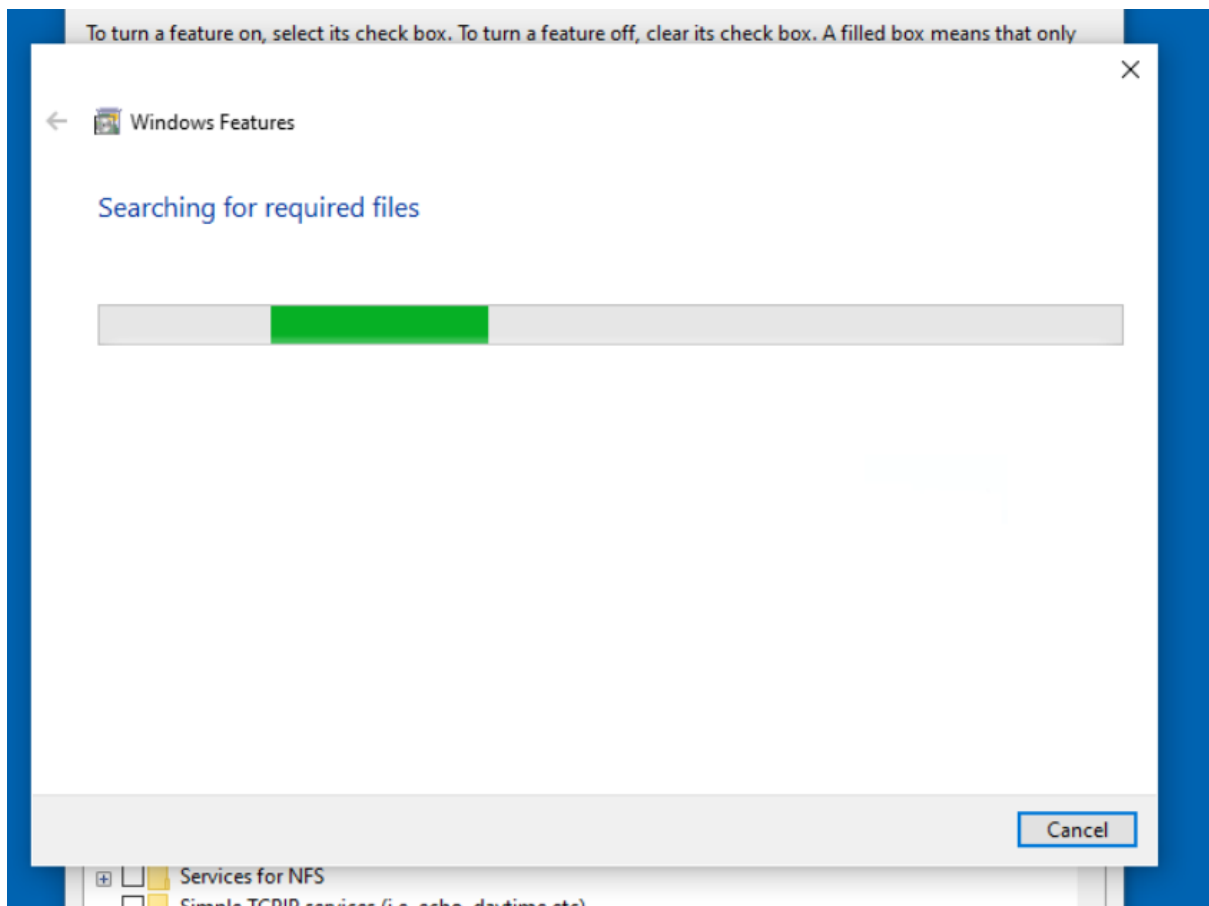

Open search tab and search for windows features turn on or off open it

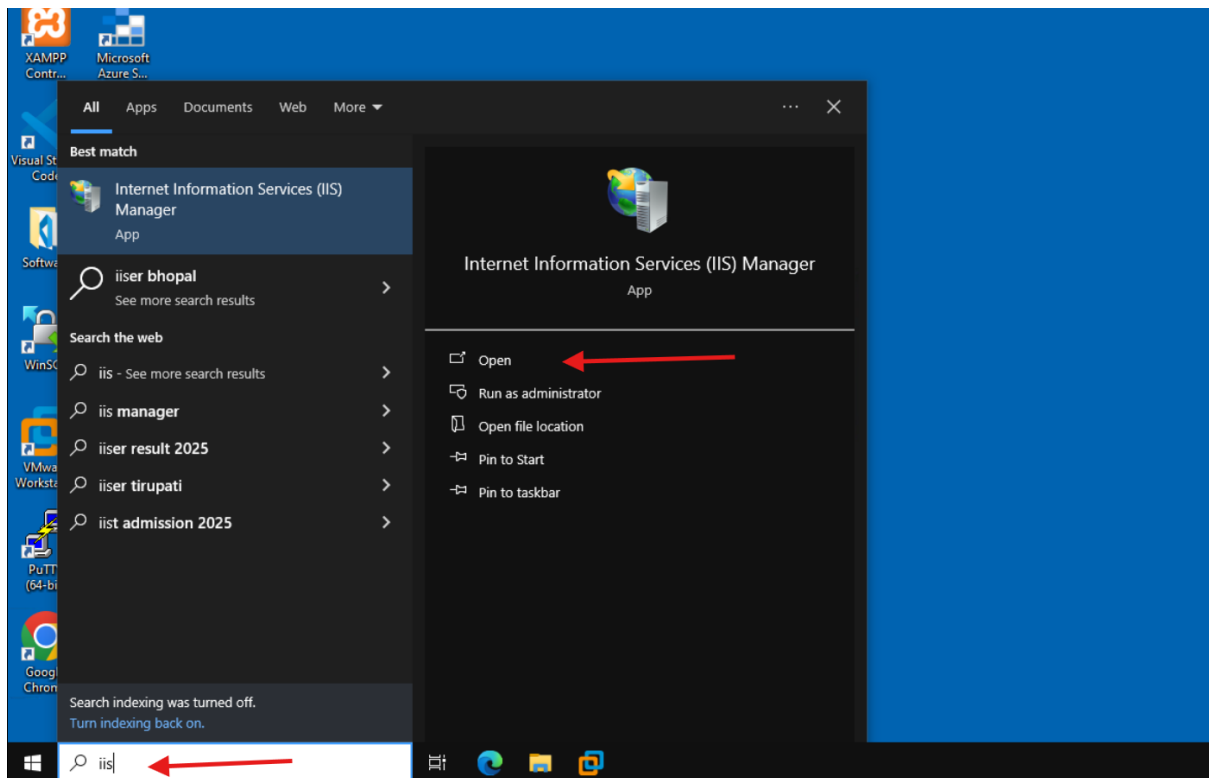

Here in this tick the Internet information service and click on ok

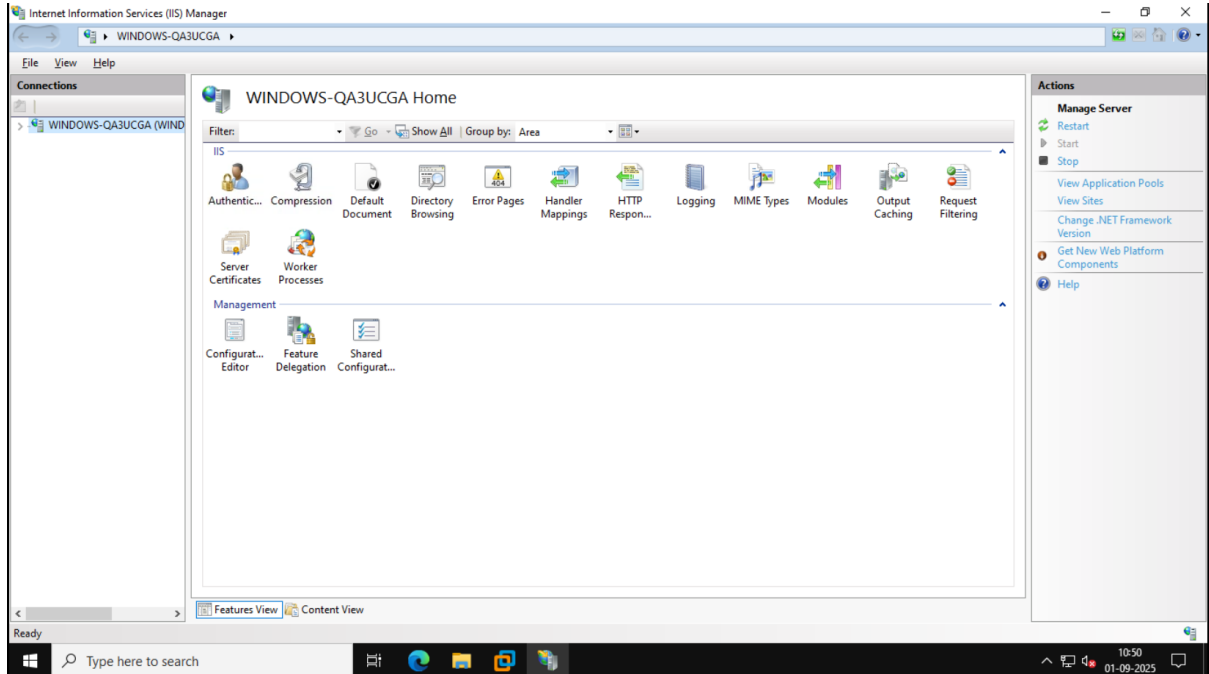

It will search for required files and apply them wait for it to apply

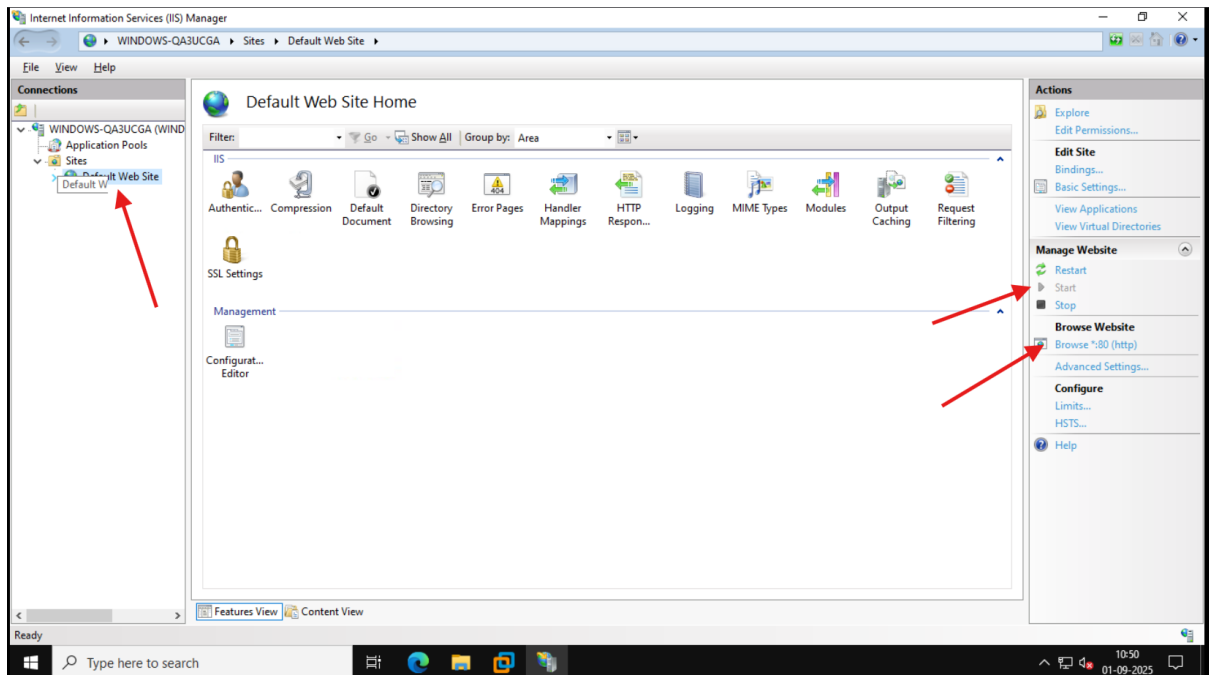

Now open the search tab type IIS and open it

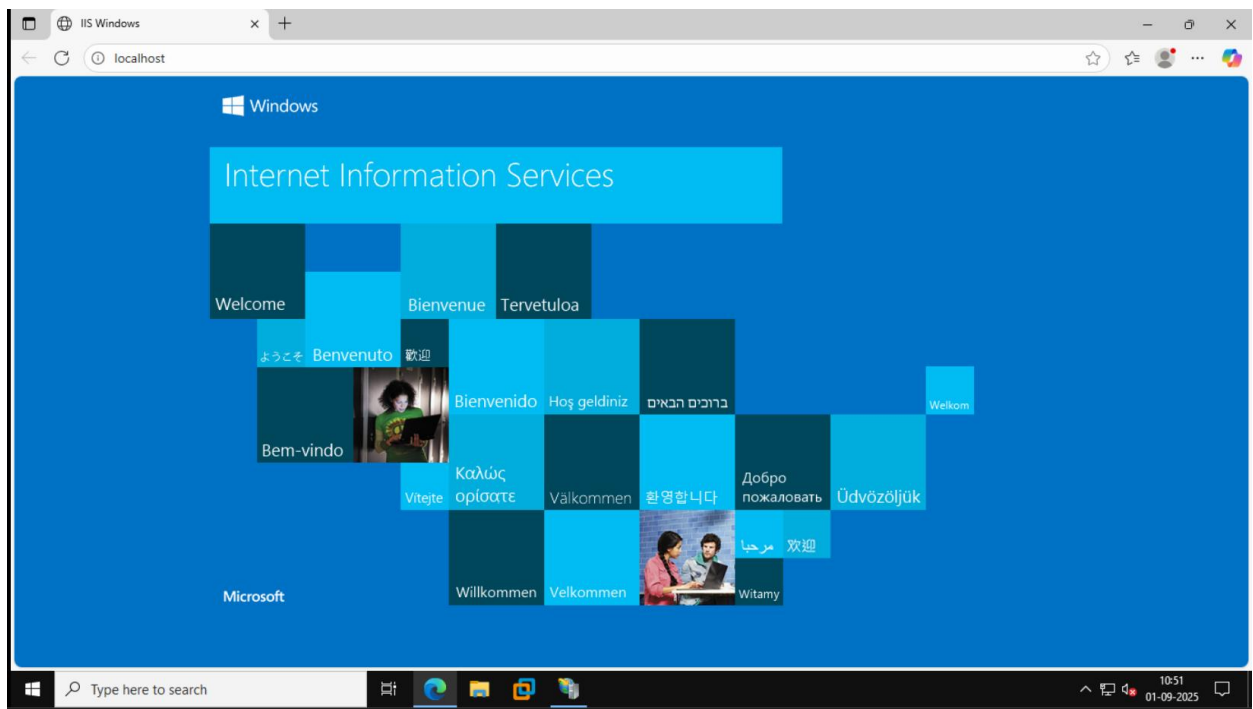

Here you can see the manager panel open

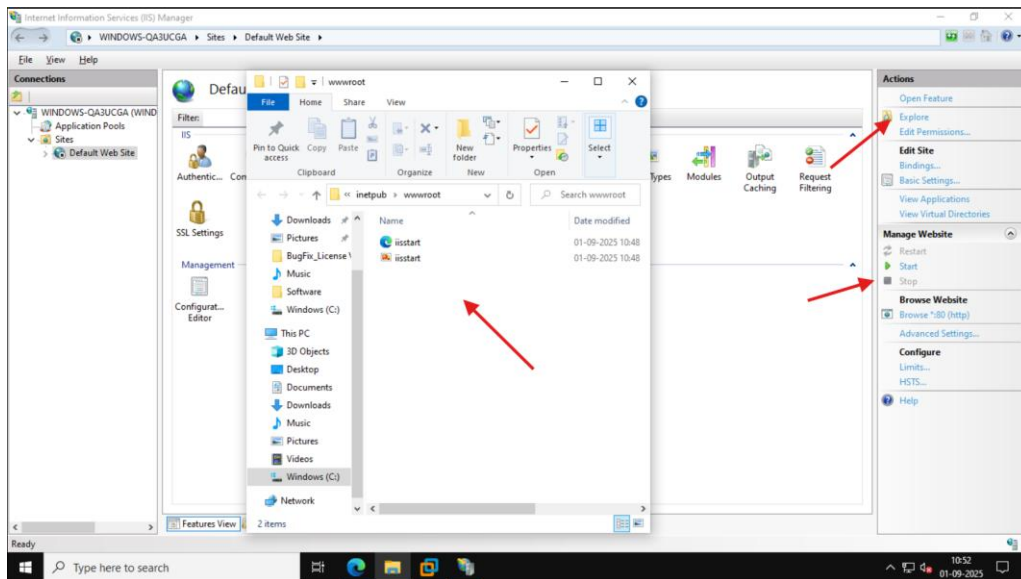

Expand the windows-QA3UCGA in that we have a default website it will automatically start the site now you can click on browse* 80 to see the site

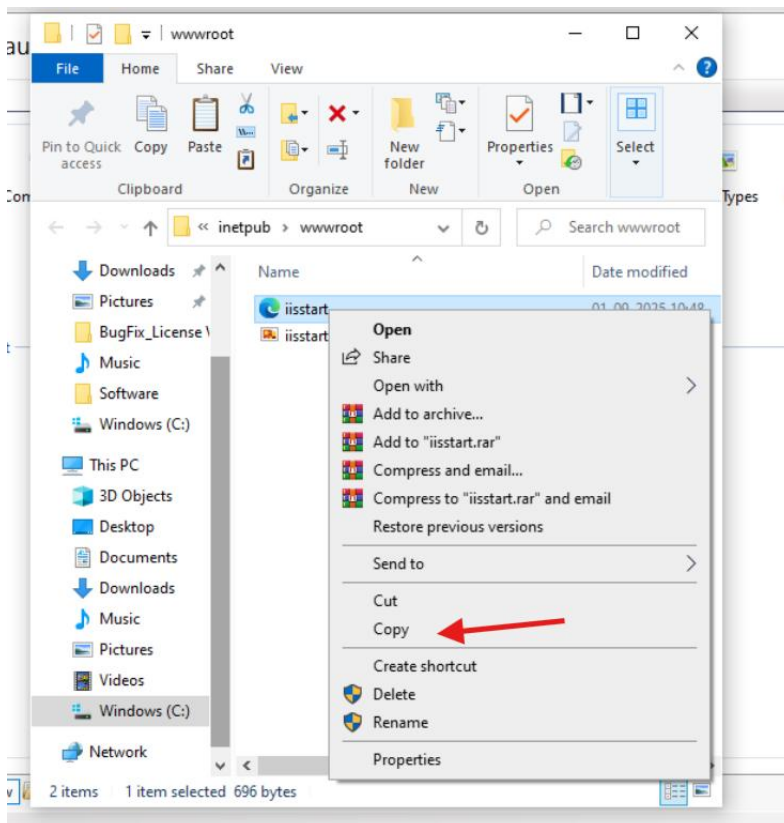

The URL will be redirected to localhost which is on port 80

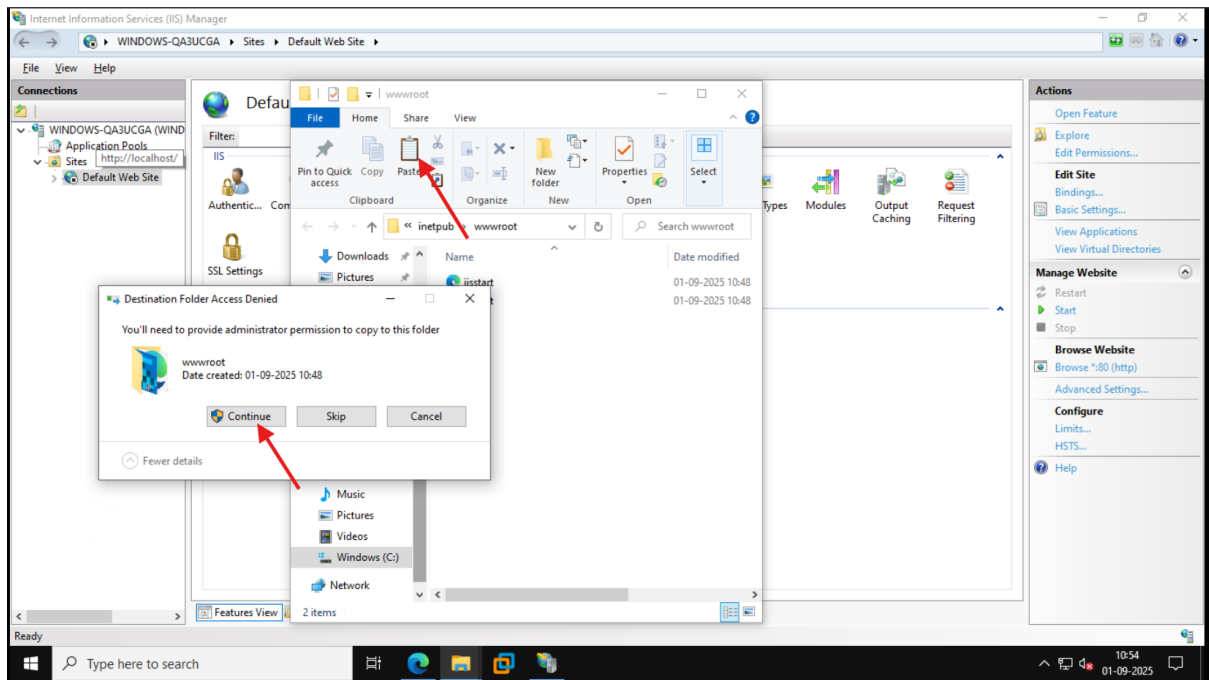

In the manager panel click on explore the files explorer will open with path to the iisstart.htm file contain folder

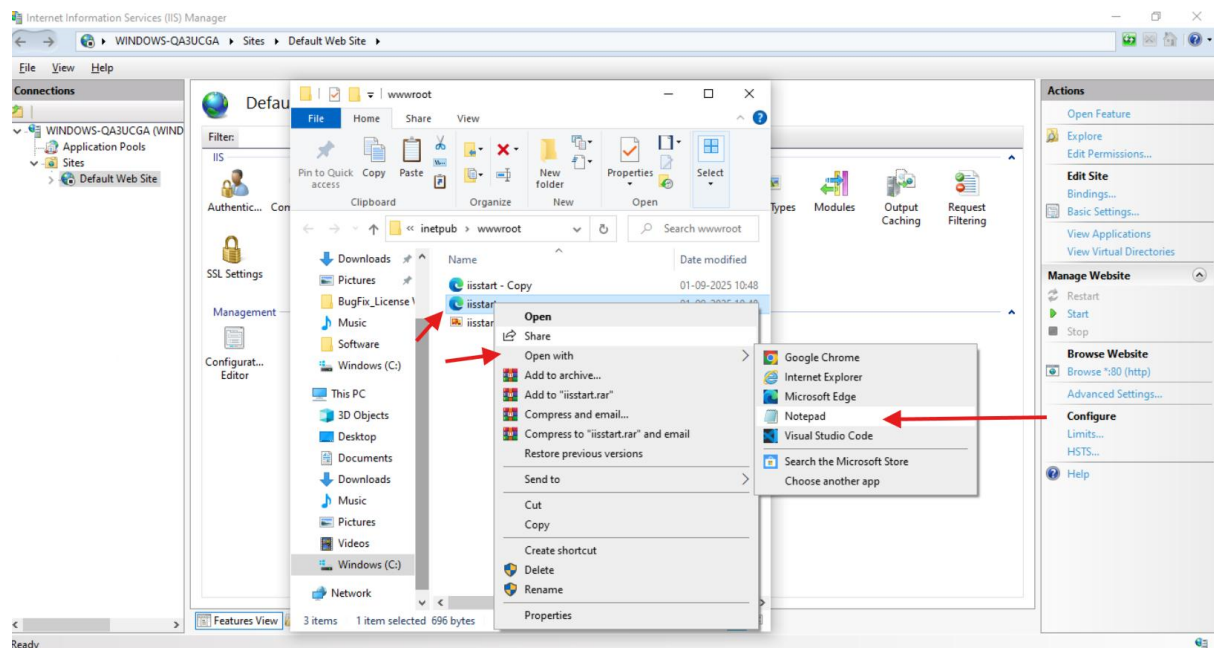

Copy the iisstart.htm file

Paste it their itself only it will ask for permission allow it to continue

Open the iisstart.html with notepad

In that remove anything if there and paste this

```
<html>
```

```
<head>
```

```
<title>IIS Windows</title>
```

```
</head>
```

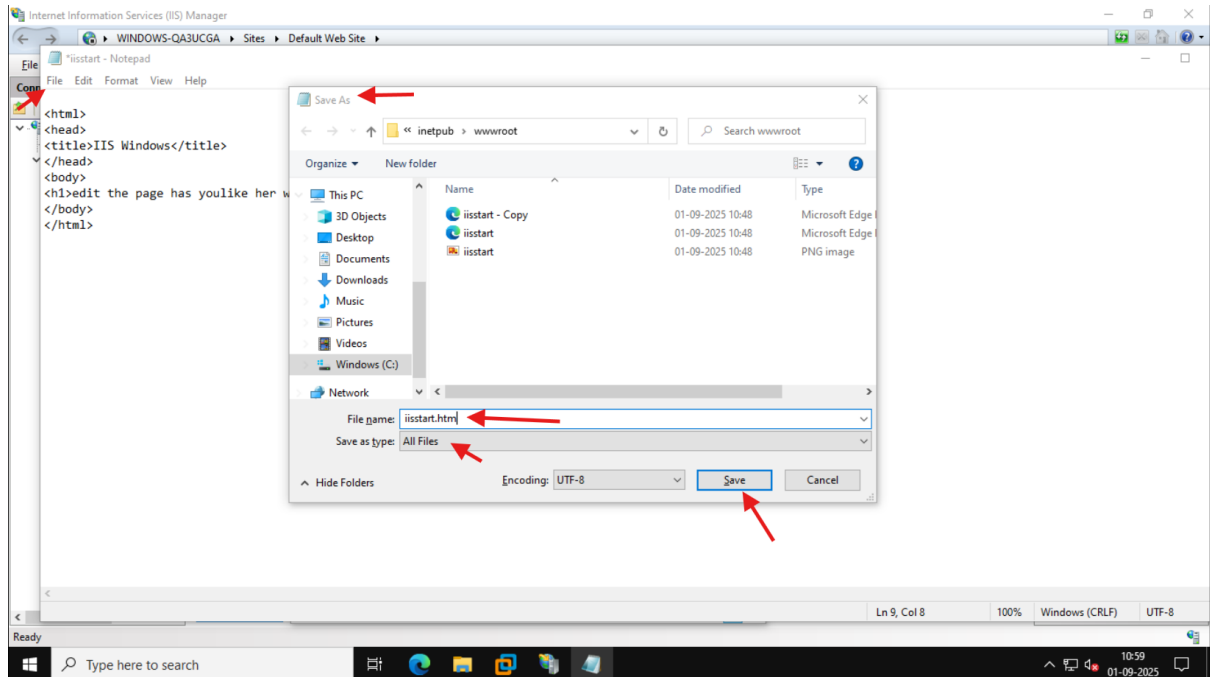

```
<body>
```

<h1>edit the page has youlike her we can ass tags and tables related to HTML
JAVASCRIPT and CSS </h2>

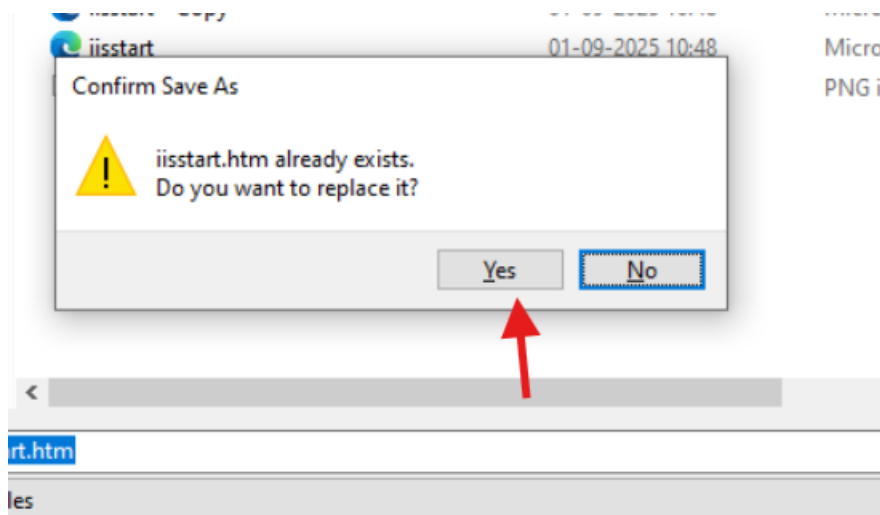

</body>

</html>

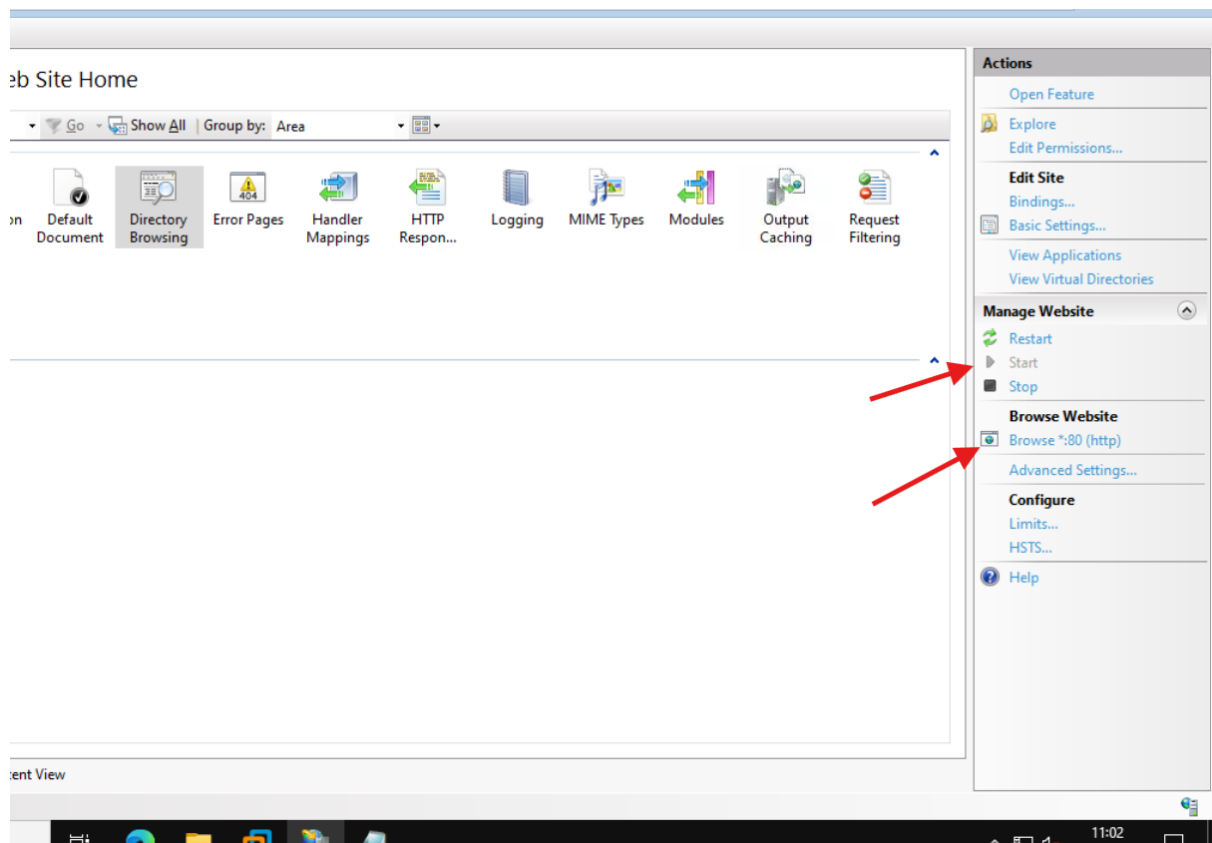

Save it as iisstart.htm only

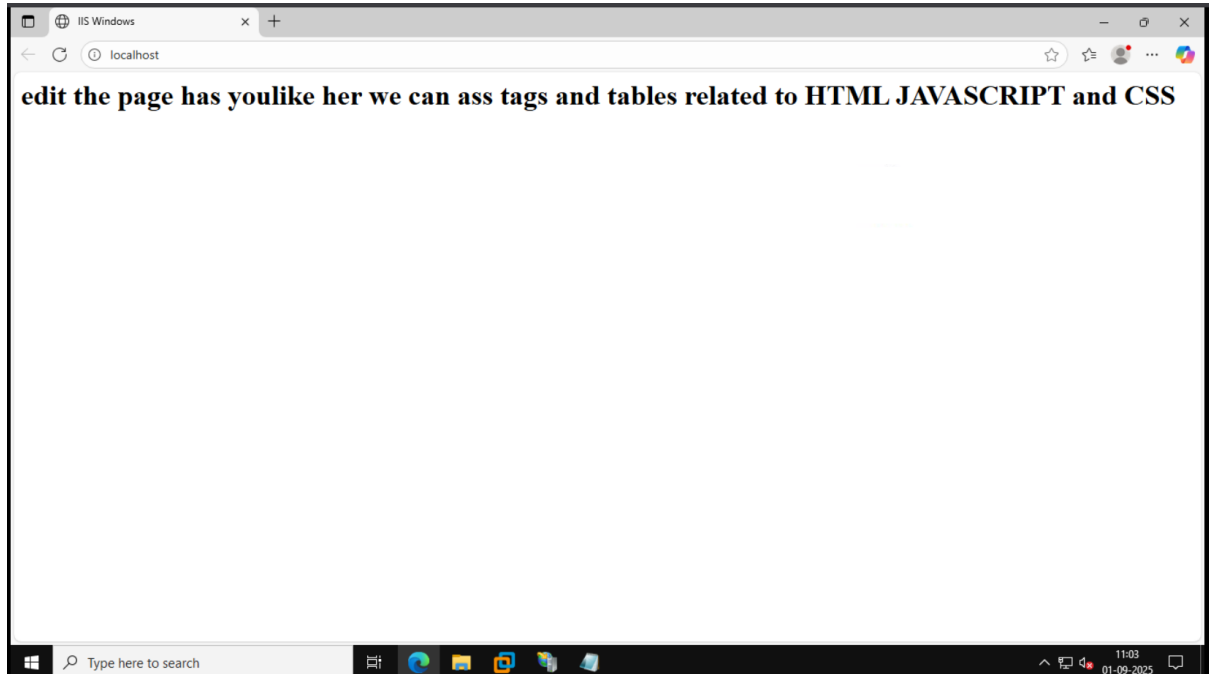

Here we have to replay but we after the previous file backup copy so it okay to replace

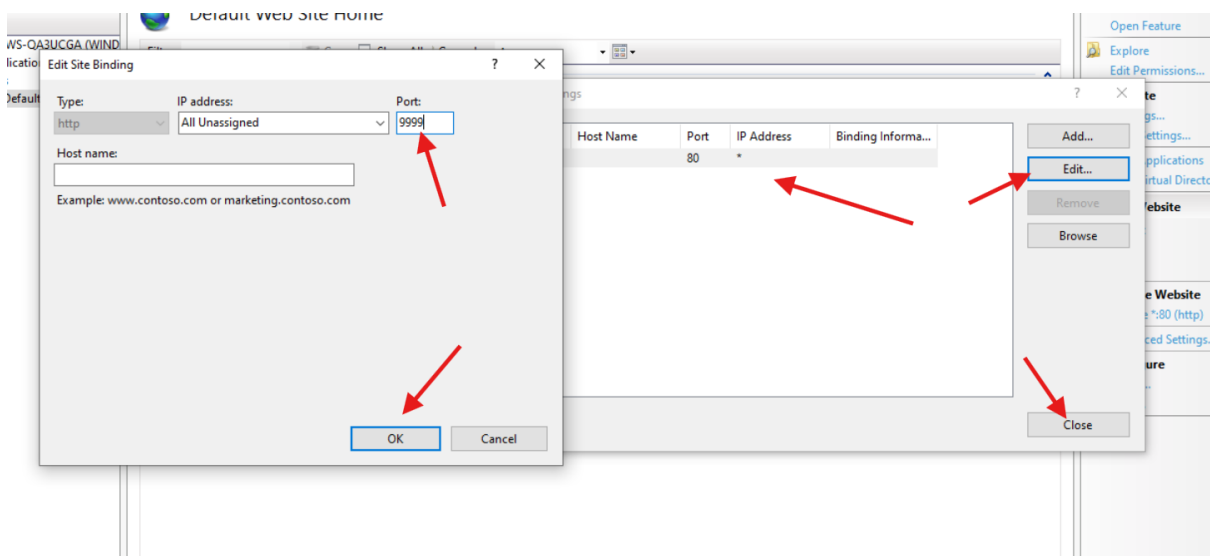

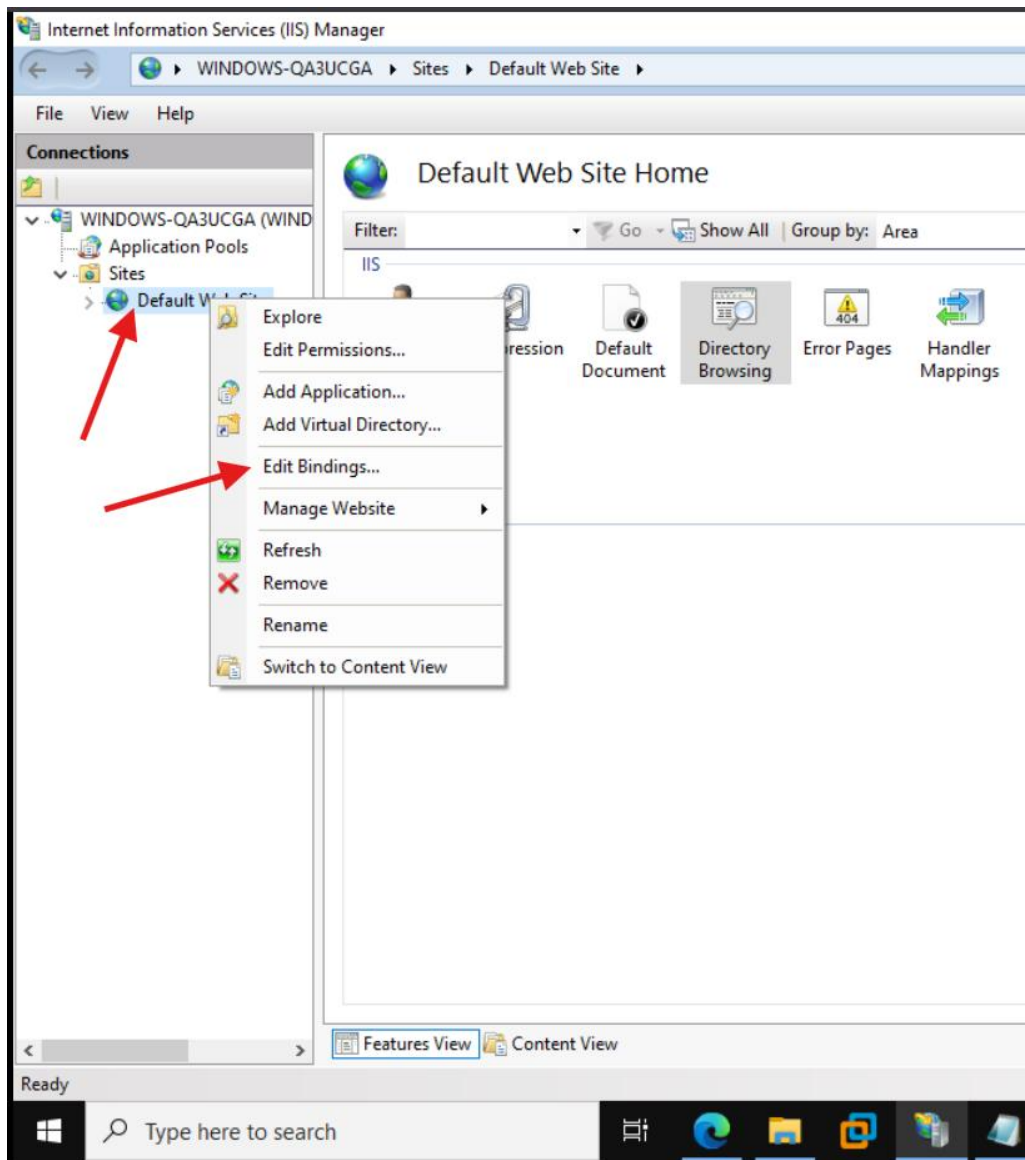

Now stop and start it again browser though the port 80 localhost

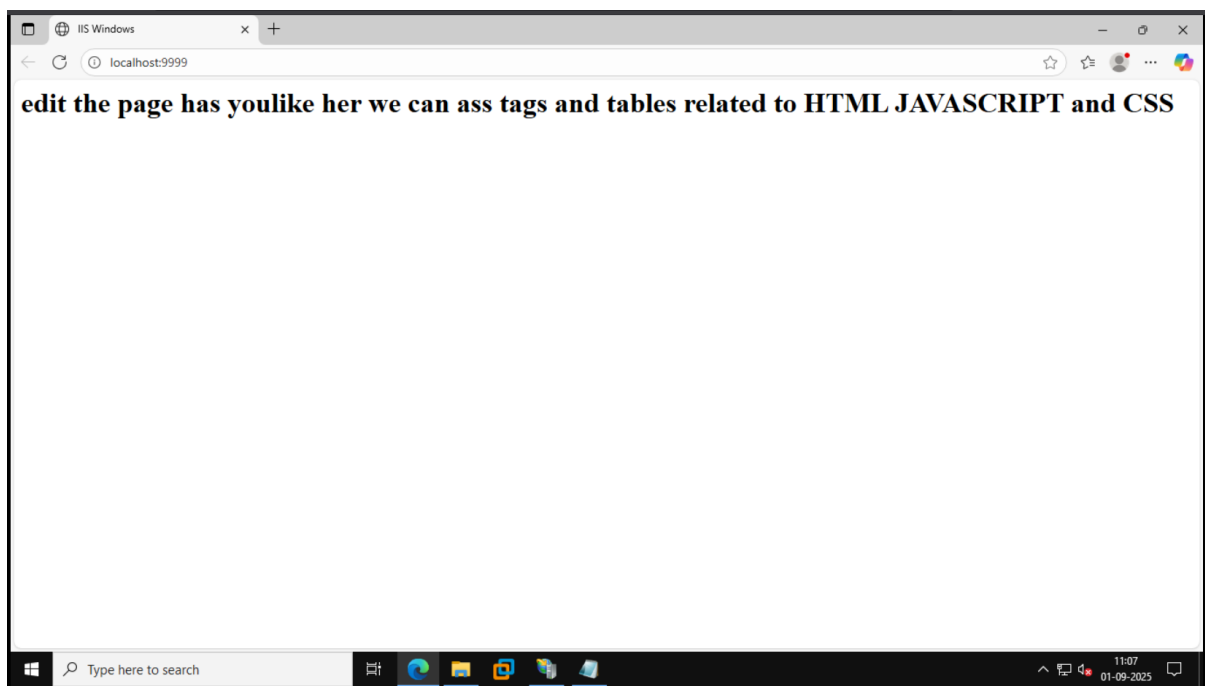

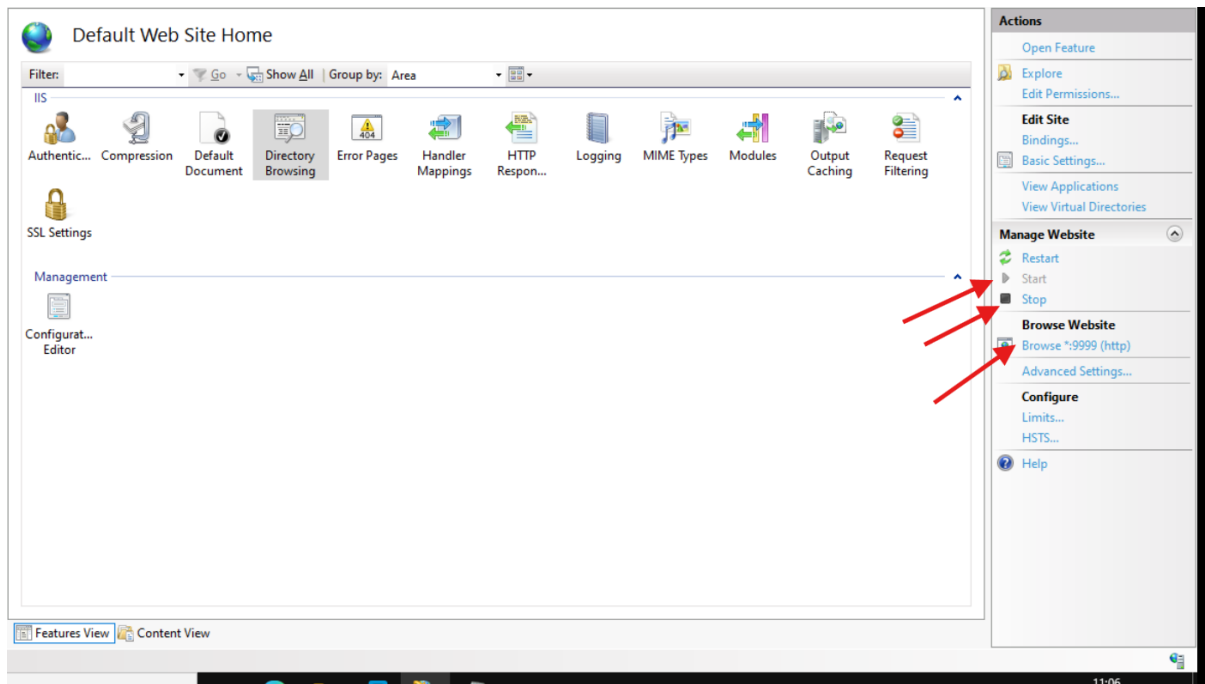

You will see your page

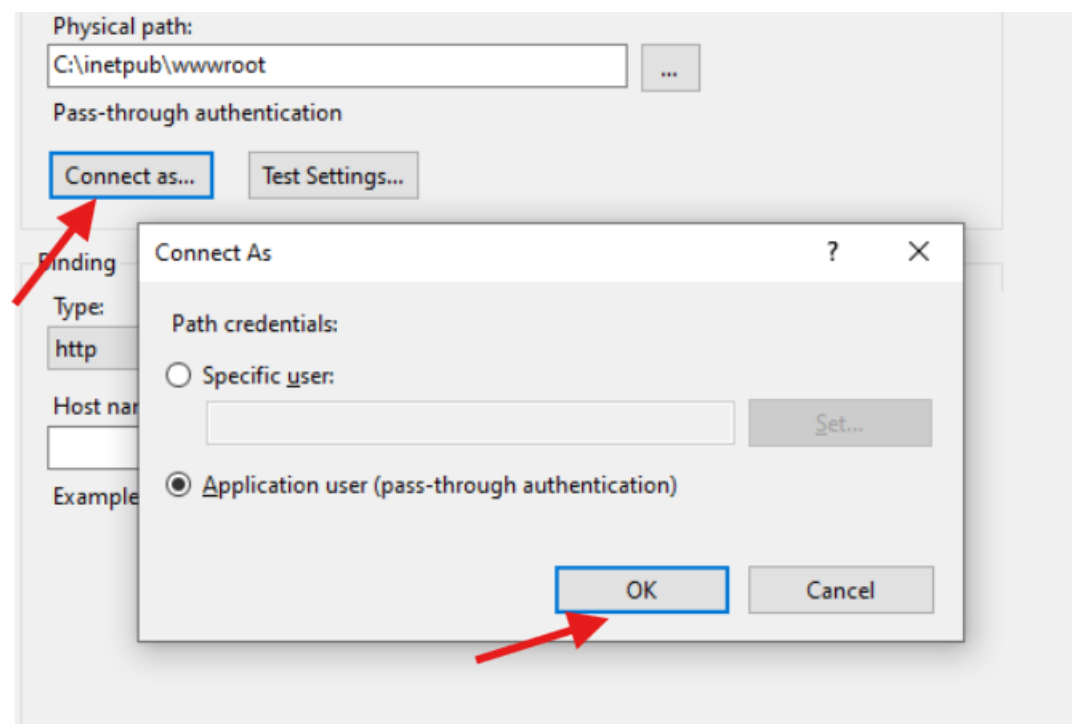

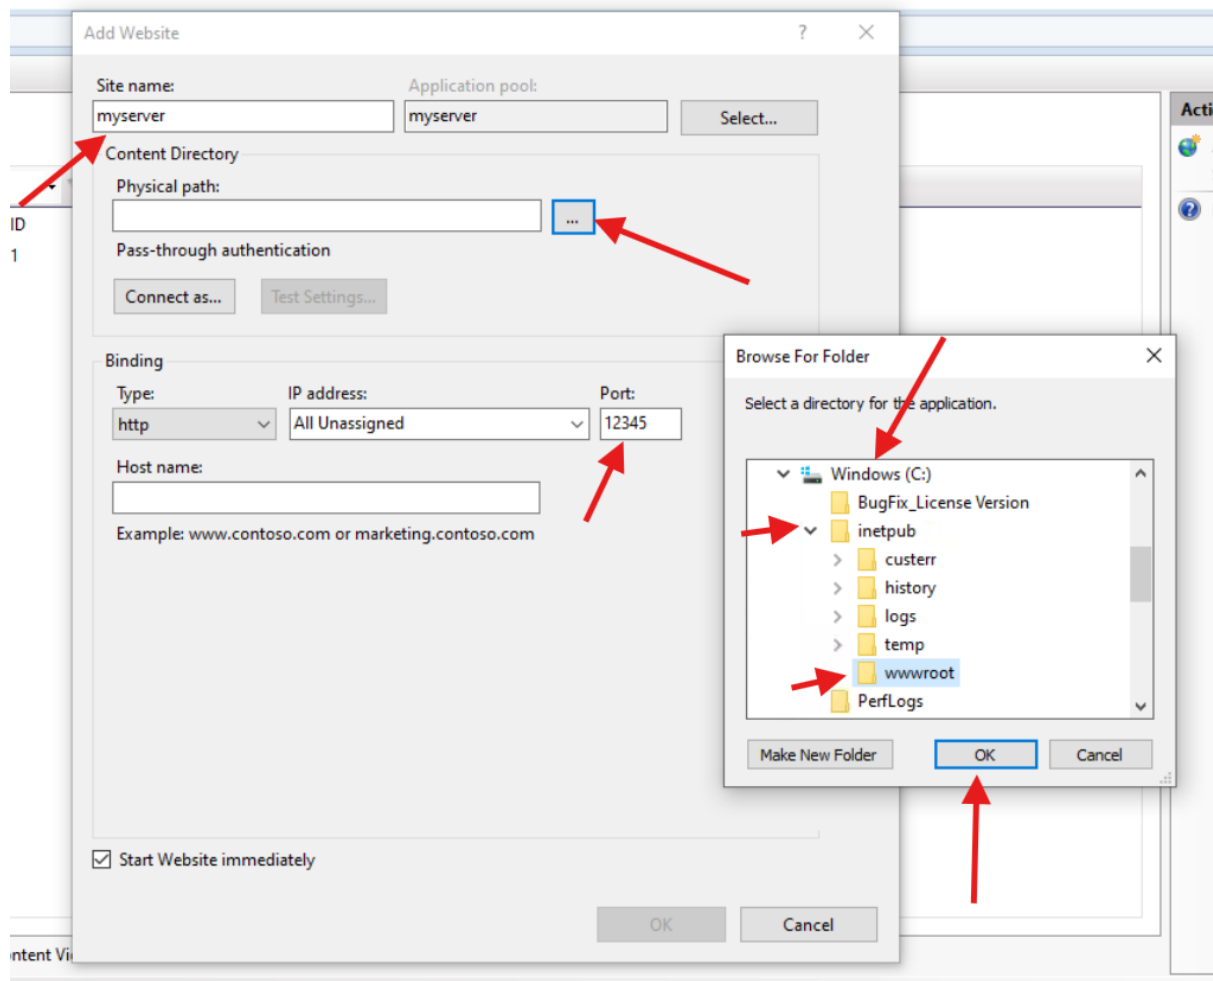

Here we are changing the port number to 99999 in edit bindings

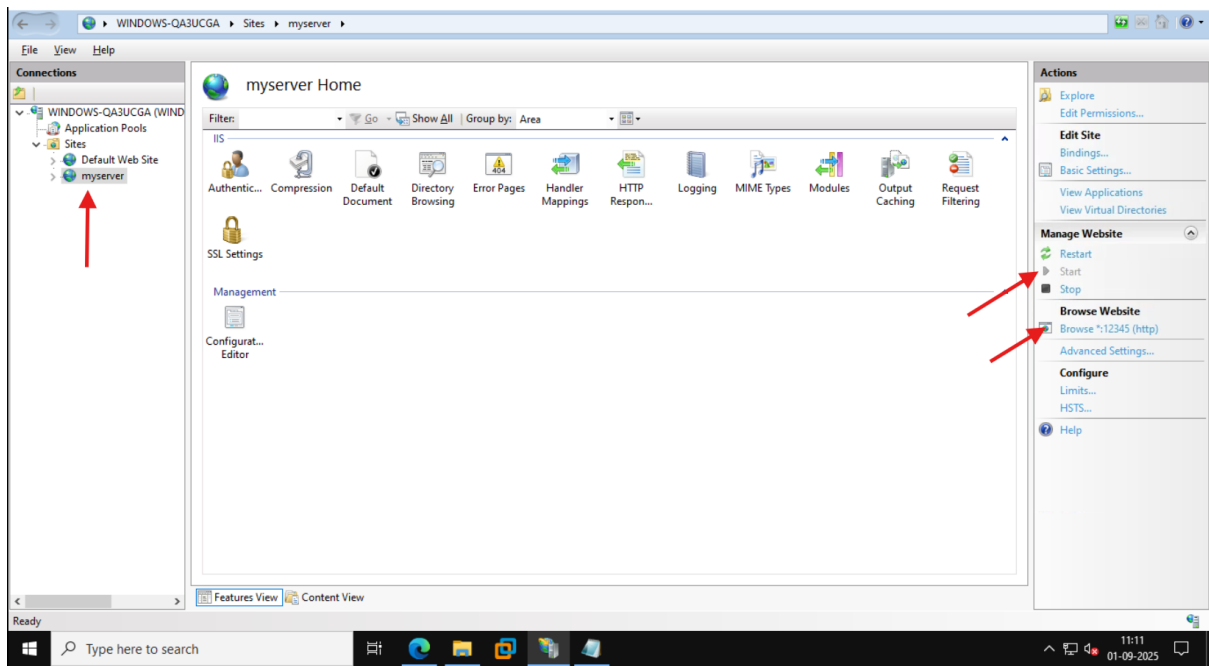

Now again stop and start the site

Now we will create a new website call it myserver with port number 12345 and given the physical path same as previous

Browse through the port 12345 you will see the same site because we have given same physical path as previous site
