

Install and configure Active Directory, Create OU and add users-07

1. Introduction

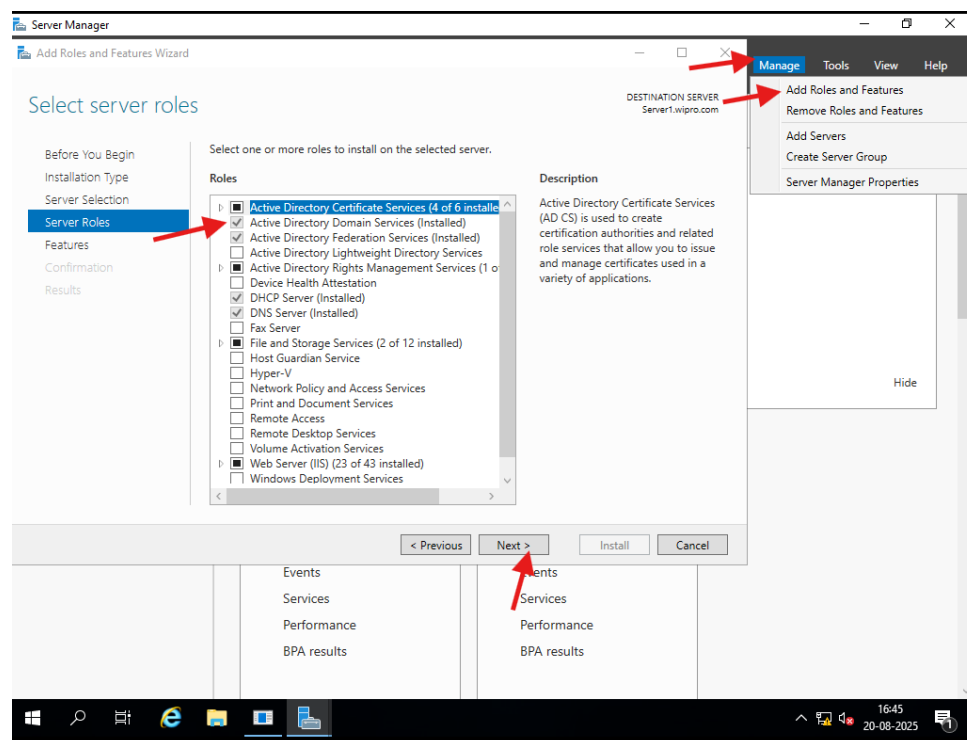

Active Directory (AD) in Windows Server 2019 is a directory service used to store information about objects like users, groups, and computers. It provides authentication, authorization, and centralized management. An **Organizational Unit (OU)** helps group and manage these objects more efficiently.

2. Prerequisites

- A system running **Windows Server 2019**.
- Static IP address configured.
- Administrator privileges.
- Server Manager installed.

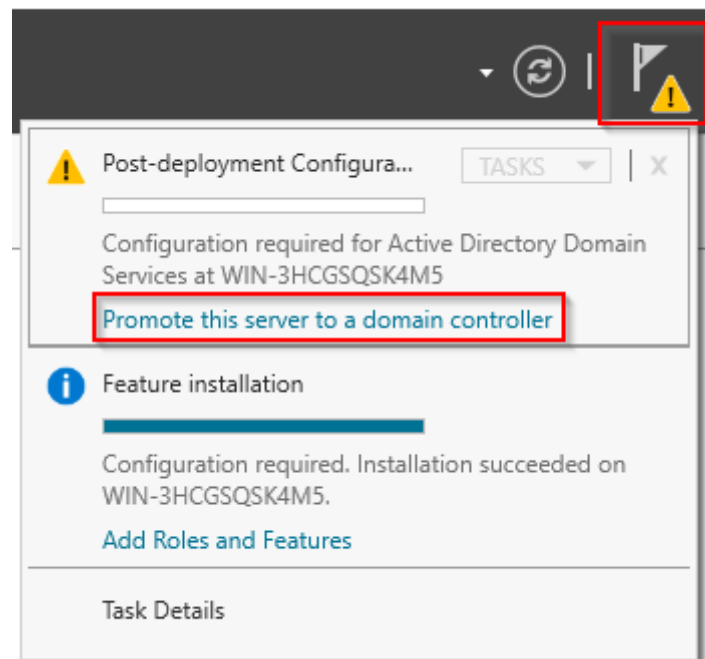

3. Steps to Install Active Directory Domain Services (AD DS)

Step 1: Add AD DS Role

- Open Server Manager → Add Roles and Features.
- Choose Role-based or Feature-based Installation.
- Select your server.
- Check Active Directory Domain Services.
- Install the role.

Step 2: Promote Server to Domain Controller

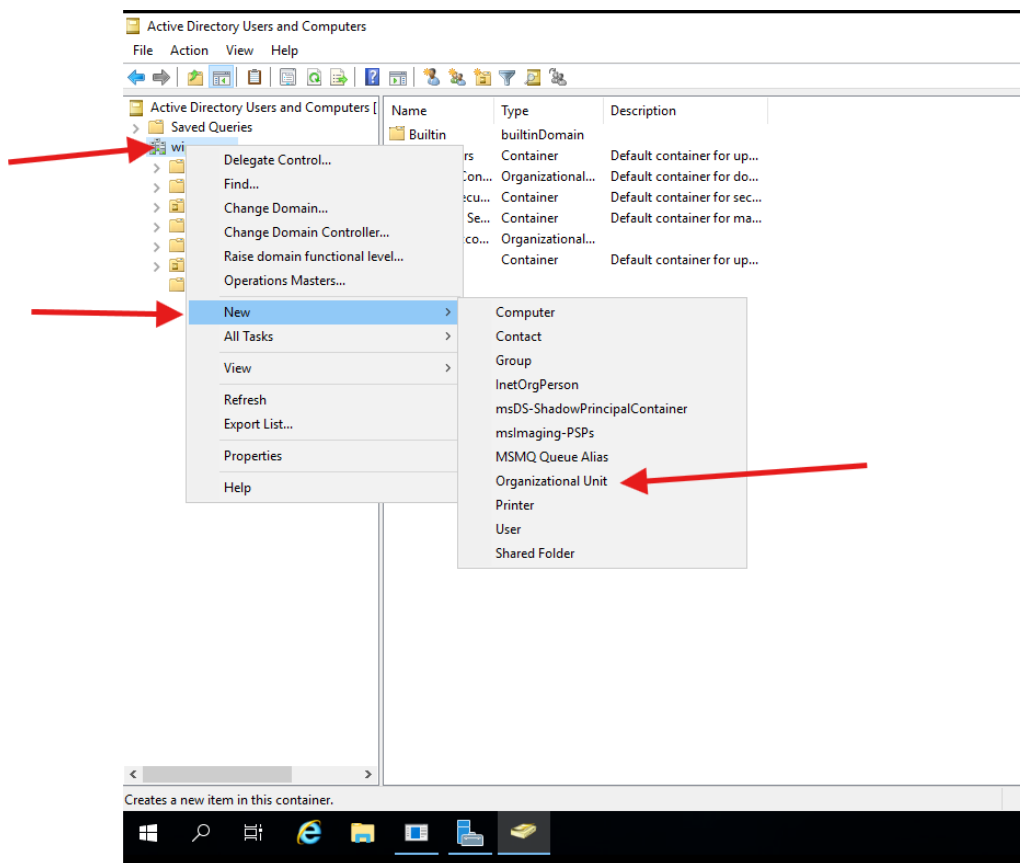

- In **Server Manager**, click the notification flag.
- Select **Promote this server to a domain controller**.
- Choose **Add a new forest** and provide a domain name (e.g., wipro.com).
- Set **Directory Services Restore Mode (DSRM)** password.
- Complete installation and restart the server.

4. Create an Organizational Unit (OU)

Step 1: Open Active Directory Users and Computers

- Go to **Start → Administrative Tools → Active Directory Users and Computers (ADUC)**.

Step 2: Create a New OU

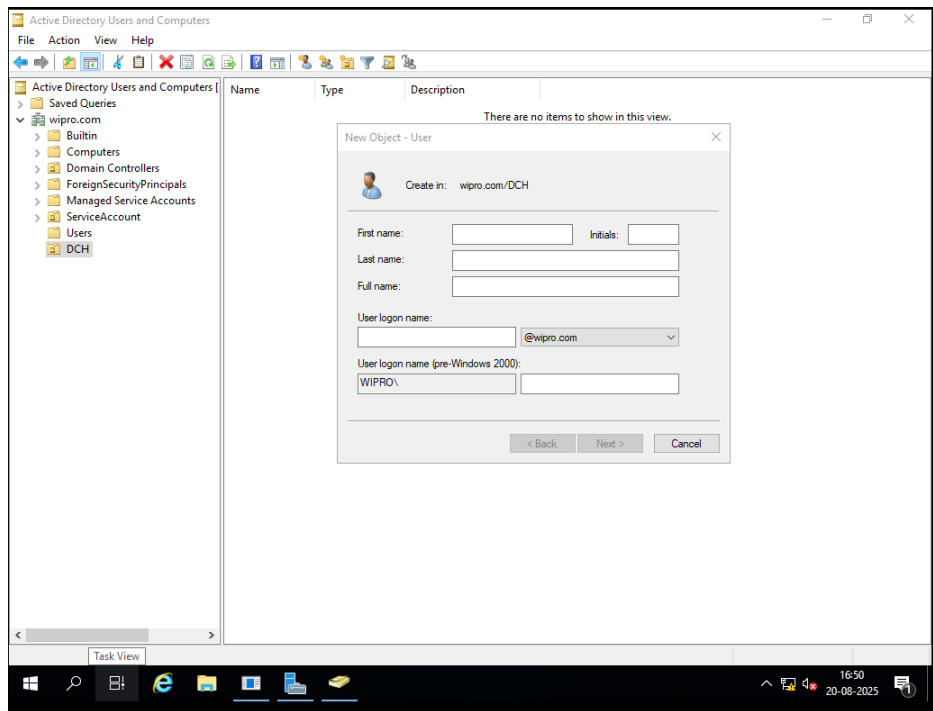

- Right-click your domain (e.g., wipro.com).
- Select **New → Organizational Unit**.
- Name it (e.g., IT_Department).

5. Add Users to OU

Step 1: Create New User

- Right-click the OU you created (e.g., IT_Department).
- Select **New → User**.
- Enter details (First name, Last name, User logon name).

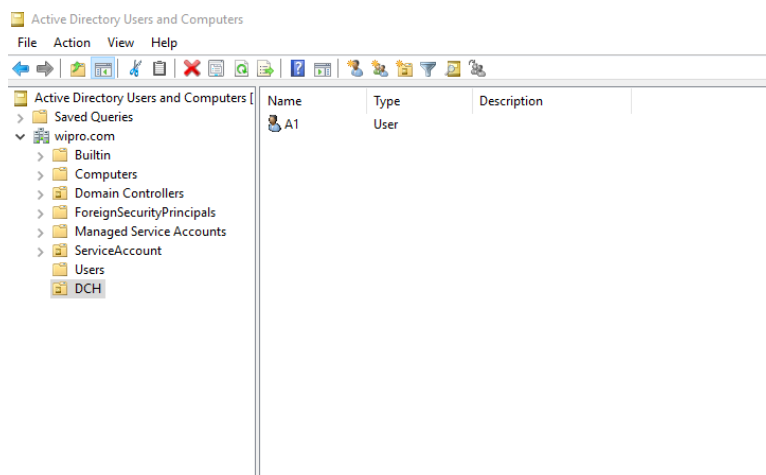

Step 2: Set Password

- Set initial password.
- Select options like User cannot change password.

Step 3: Complete User Creation

- Finish wizard.
- The new user will now appear inside the OU.

6. Verification

- Log in with the newly created user credentials on a client system.
- Check if the user account works under the domain.
